

Sand Sculpture Size

Size makes an impact on both the public, and the media. A sculpture looks best when it is not dwarfed by the space that it inhabits. On indoor projects this can vary in relation to floor space, or ceiling height. Many times available space or the length of an event will dictate the optimum size of the sculpture. On outdoor projects the sky is literally the limit. Subject matter also has an effect on the composition of the finished sculpture. For instance, a 50 ton sculpture of a cathedral would be considerably taller than a 50 ton sculpture of an automobile

This illustration accurately represents the relative mass of our most common sand sculpture sizes. Keep in mind that subject matter and sand quality has an affect on the sculptures height. Footprint dimensions shown are general square footage requirements, actual shape and dimensions of the sculptures footprint are flexible.
